

University Saleh Boubnider Constantine 3.
Laboratory of General Anatomy.
Course intended for first-year medical students.
Academic year 2025/2026

Faculty of Medicine. Department of Medicine.
Head physician: Pr Boukabache L
Dr Hamdi M

ARM MUSCLES

PLAN

I. INTRODUCTION

II. DESCRIPTIVE ANATOMY

A. MUSCLES OF THE ANTERIOR COMPARTMENT

B. MUSCLES OF THE POSTERIOR COMPARTMENT

I. INTRODUCTION:

The arm is divided into two muscular compartments: anterior and posterior, by the medial and lateral intermuscular septa.

II. DESCRIPTIVE ANATOMY:

A. ANTERIOR COMPARTMENT:

Composed of two layers

a) Deep layer: consists of two muscles

1. Coracobrachialis muscle

- Origin: coracoid process of the scapula.
- Body: elongated muscle located in the proximal part of the arm.
- Insertion: medial surface of the humerus.
- Action: flexor and adductor of the arm.
- Innervation: musculocutaneous nerve.

2. Brachialis muscle:

- Origin: lower half of the medial and lateral surfaces of the humerus.
- Body: thick, flattened muscle.
- Insertion: coronoid process of the ulna.
- Action: flexor of the forearm.
- Innervation: musculocutaneous nerve.

b) Superficial layer

3. Biceps brachii muscle:

- Origin:

Long head: supraglenoid tubercle of the scapula.

Short head: coracoid process of the scapula.

- Body: long, fusiform muscle.
- Insertion: by a terminal tendon on the radial tuberosity (bicipital tuberosity).
- Action: flexor of the forearm, supinator of the forearm when pronated.
- Innervation: musculocutaneous nerve.

B. POSTERIOR COMPARTMENT:

Composed of the triceps brachii, which has three heads: long, medial, and lateral.

1. Triceps brachii muscle:

- Origin:

Long head: infraglenoid tubercle of the scapula.

Medial and lateral heads: posterior surface of the humerus.

- Body: elongated muscle located at the back of the arm.
- Insertion: by a terminal tendon on the olecranon.
- Action: extensor of the elbow.
- Innervation: radial nerve.
