

Lesson 1: Text: Healthcare Choices and Economic Impact

Healthcare is an important part of every society. People need medical services to stay healthy, work, and live better lives. However, healthcare is not free. Hospitals, doctors, medicines, and medical equipment all have costs. Health economics studies how societies manage these costs and make decisions about healthcare.

One important question in health economics is how healthcare is paid for. In some countries, the government pays most healthcare costs through taxes. In other countries, patients pay directly or use health insurance. Each system has advantages and disadvantages. Government-funded healthcare can help poor people, but it can be expensive for the state. Private healthcare can offer faster services, but not everyone can afford it.

Health economists also study how people make healthcare decisions. For example, a patient may delay visiting a doctor because of high costs. This delay can make the illness worse and more expensive to treat later. From an economic point of view, prevention is often cheaper than treatment.

Another key issue is resource allocation. Resources such as hospital beds, doctors, and medical equipment are limited. Health economists analyze how to use these resources efficiently to help the greatest number of people. Good healthcare planning can improve public health and reduce unnecessary spending.

In conclusion, health economics connects healthcare with economic decision-making. Understanding this field helps future professionals improve healthcare systems and make better policies for society.

Vocabulary Focus:

- **Healthcare:** services that help people stay healthy
- **Costs:** money that must be paid
- **Health insurance:** a system that helps pay medical expenses
- **Prevention:** actions taken to stop illness before it starts
- **Treatment:** medical care given to cure illness
- **Resources:** things that are available and can be used
- **Efficiently:** without wasting time or money

Lesson 2: Grammar Focus

Present Simple & Passive Voice in Health Economics

Grammar from the Text (lesson 1)

1. Present Simple (Form & Use)

Use

We use the **present simple** to talk about:

- facts
- routines
- general truths

Examples from the text:

- Health economics **studies** healthcare systems.
- People **need** medical services.

Form

- Subject + base verb (+ s / es for he, she, it)

Example:

- Health economists **analyze** costs.
- The government **pays** for healthcare.

2. Passive Voice (Present Simple Passive)

Use

We use the **passive voice** when:

- the action is more important than the person
- the agent is unknown or not important
(very common in academic and medical contexts)

Form

- **am / is / are + past participle**

Examples from the text:

- Healthcare **is paid for** through taxes.
- Resources **are used** efficiently.

Lesson 3: text: Access to Healthcare Services

Access to healthcare services is an important issue in many countries. In some areas, there are enough hospitals and doctors for the population. In other areas, especially rural regions, access to healthcare is limited. People may travel long distances to receive medical care.

There are many factors that affect access to healthcare. Cost is one major factor. When medical services are expensive, people may avoid visiting a doctor. Another factor is availability. In some regions, there are not enough hospitals, doctors, or medical equipment. As a result, patients may wait a long time for treatment.

Good healthcare planning can improve access to services. When there are enough resources and trained staff, public health improves and healthcare systems work more effectively.

Vocabulary Focus :

- **Access:** the ability to use or obtain something
- **Healthcare services:** medical care provided by doctors and hospitals
- **Rural areas:** regions outside cities, often with fewer services
- **Availability:** how easy it is to find or use something

Lesson 4: Grammar Focus

There is / There are (grammar from the text: lesson 2)

Use:

We use **there is** / **there are** to say that something exists or is available.

Examples from the text:

- There **are** enough hospitals in some areas.
- There **are not** enough doctors in rural regions.

Form:

- There **is** + singular noun
- There **are** + plural noun

Grammar Practice

Choose the correct form:

1. There (is / are) many hospitals in big cities.
2. There (is / are) a lack of doctors in rural areas.
3. There (is / are) high healthcare costs in some countries.

Lesson 5: Reading Text: Quality of Care and Patient Experience

Quality of care is a key concept in modern healthcare systems. Patients expect medical services that are safe, effective, and respectful. A good patient experience can improve recovery and increase trust in medical institutions.

Several factors influence quality of care. One factor is communication. When doctors explain problems clearly, patients feel more confident. Another factor is waiting time. Shorter waiting times usually lead to higher patient satisfaction. Clean facilities and well-trained staff also play an important role.

From an economic perspective, better quality of care can reduce future problems. Patients who receive clear information and proper care are less likely to return with complications. As a result, healthcare systems become more sustainable and efficient.

Vocabulary Focus

- **Quality of care:** the standard of medical services given to patients
- **Patient experience:** how patients feel about the care they receive
- **Effective:** producing the desired result
- **Waiting time:** the period a patient waits before receiving care
- **Satisfaction:** the feeling of being pleased with a service
- **Facilities:** buildings and equipment used for a specific purpose
- **Sustainable:** able to continue over time without problems

Lesson 6: Grammar Focus

Comparatives (from the text: lesson 5)

Use:

We use **comparatives** to compare two things.

Examples related to the text:

- Shorter waiting times lead to higher satisfaction.
- Better communication improves patient experience.

Form:

- Short adjectives: adjective + **-er**
 - short → shorter
- Long adjectives: **more + adjective**
 - effective → more effective

Grammar Practice

Choose the correct form:

1. Short waiting times are (gooder / better) for patients.
2. Clear explanations make care (more effective / effectiver).
3. Clean facilities are (important / more important) than poor ones.

Lesson 7: Reading Text Health Policy and Decision-Making

Health policy plays a central role in national development. Governments must make decisions about how to improve population well-being with limited budgets. These decisions require careful planning and clear priorities.

Policy makers often face difficult choices. They must decide which programs receive funding and which areas need immediate attention. For example, investing in training programs can improve professional skills, while investing in technology can increase system performance. Each choice has long-term effects.

Good decision-making helps create balanced and fair systems. When priorities are clear and resources are managed wisely, public outcomes improve. For this reason, strong health policy is essential for social stability and economic growth.

Vocabulary Focus

- **Health policy:** official plans and actions to improve public well-being
- **Decision-making:** the process of choosing between options
- **Budget:** the amount of money available to spend
- **Priorities:** the most important goals or needs
- **Funding:** money provided for a specific purpose
- **Outcomes:** results or effects of actions
- **Stability:** a condition of balance and continuity

Lesson 8: Grammar Focus

Should / Should Not (from the topic)

Use:

We use **should** and **should not** to give advice or make recommendations.

Examples related to the text:

- Governments **should** set clear priorities.
- Policy makers **should not** ignore long-term effects.

Form:

- Subject + **should** / **should not** + base verb

Grammar Practice

Choose the correct option:

1. Governments (should / should not) plan budgets carefully.
2. Policy makers (should / should not) think about future outcomes.
3. Public funds (should / should not) be wasted.

Lesson 9: Reading Text: The Health Workforce and Economic Challenges

The health workforce is essential for the functioning of any health system. Doctors, nurses, technicians, and administrators perform different roles that support patient care. Without qualified workers, health systems cannot operate properly.

Many countries face workforce challenges. Low wages can reduce motivation and increase staff turnover. In some regions, workers leave public institutions to seek better opportunities elsewhere. This situation creates pressure on remaining staff and affects service delivery.

Training and professional development can improve workforce performance. Skilled professionals can work more effectively and respond better to patient needs. From an economic perspective, investing in human capital strengthens health systems and improves long-term productivity.

Vocabulary Focus

- **Workforce:** all the people working in a specific sector
- **Technicians:** trained workers who operate equipment or perform technical tasks
- **Wages:** money paid regularly for work
- **Turnover:** the rate at which employees leave and are replaced
- **Opportunities:** chances for improvement or advancement
- **Professional development:** training that improves skills and knowledge
- **Human capital:** the skills and abilities of workers

Lesson 10: Grammar Focus

Can / Cannot (Ability & Possibility)

Use:

We use **can** and **cannot** to talk about:

- ability
- possibility

Examples related to the text:

- Skilled workers **can** improve system performance.
- Health systems **cannot** function without trained staff.

Form:

- Subject + **can / cannot** + base verb

Grammar Practice

Choose the correct form:

1. Trained professionals (can / cannot) respond better to challenges.
2. Health systems (can / cannot) work well without staff.
3. Investment in training (can / cannot) improve productivity.

Lesson 11: Reading Text: Health Data and Informed Decisions

Health data plays an important role in modern health systems. Institutions collect information about diseases, service use, and population trends. This information helps authorities understand current situations and plan future actions.

Accurate data improves decision quality because it shows real needs and patterns. For example, an increase in chronic illness rates can signal the need for early intervention programs. When data is incomplete, decisions become less reliable, so resources may be misdirected.

From an economic point of view, data analysis supports efficient planning. Better information leads to better strategies, so health systems can respond more effectively to changing conditions.

Vocabulary Focus

- **Data:** facts or information used for analysis
- **Institutions:** organizations with a specific purpose
- **Trends:** general directions of change over time
- **Accurate:** correct and free from error
- **Chronic:** lasting for a long time
- **Intervention:** action taken to improve a situation
- **Strategies:** planned methods to achieve goals

Lesson 12: Grammar Focus

Because / So (Cause and Result)

Use:

- **because** introduces a reason
- **so** introduces a result

Examples related to the text:

- Data is important **because** it shows real needs.
- Information was incomplete, **so** decisions were weaker.

Form:

- Sentence + **because** + reason
- Cause + **so** + result

Grammar Practice

Choose the correct word (**because** / **so**):

1. Data is collected ____ it helps planning.
2. The information was unclear, ____ decisions were delayed.
3. Authorities need trends ____ they show long-term change.

Lesson 13: Reading Text: Innovation and the Future of Healthcare

Innovation is changing the way healthcare operates around the world. New tools and digital solutions are transforming diagnosis, monitoring, and patient interaction. These changes influence how services are delivered and how patients experience care.

In the future, technology will play a bigger role in medical services. Remote consultations will allow patients to communicate with specialists without traveling. Automated processes will reduce administrative work and improve coordination between departments.

These developments will affect health economics as well. Innovation will require investment, but it will also create efficiency gains. As healthcare evolves, professionals will need to adapt to new methods and expectations.

Vocabulary Focus

- **Innovation:** the introduction of new ideas or methods
- **Digital solutions:** technology-based tools used to solve problems
- **Diagnosis:** identification of a disease or condition
- **Monitoring:** regular observation or checking
- **Remote consultations:** medical discussions without physical presence
- **Administrative work:** organizational tasks, not medical treatment
- **Efficiency gains:** improvements that save time or effort

Lesson 14: Grammar Focus

Will (Future Predictions)

Use:

We use **will** to talk about future facts or predictions.

Examples from the text:

- Technology **will play** a bigger role in healthcare.
- Innovation **will require** investment.

Form:

Subject + **will** + base verb

Grammar Practice

Choose the correct form:

1. Digital tools (will / are) change healthcare delivery.
2. Professionals (will / do) need new skills in the future.
3. Innovation (will / is) influence health economics.
