

Lesson 01: Reading Text

Demand for Healthcare Services

Demand for healthcare services refers to the number of medical services that people are willing and able to use. Demand is influenced by several factors, including income, price of services, and level of education. When people have higher income, they are more likely to seek medical care.

Price also plays an important role. If healthcare services are expensive, some individuals may reduce their use of medical care. However, in serious situations, people will still seek treatment regardless of cost.

Another important factor is awareness. People who understand the importance of health are more likely to use preventive services such as regular check-ups. From an economic perspective, understanding demand helps governments and institutions plan better healthcare systems.

Vocabulary Focus

- Demand: the desire and ability to use a service
- Income: money earned
- Awareness: knowledge or understanding
- Preventive services: actions to avoid illness
- Check-up: routine medical examination

Lesson 02: Grammar Focus

Adverbs of Frequency (Healthcare Context)

Use:

We use adverbs of frequency to describe how often something happens.

Common Adverbs:

- Always
- Usually
- Often
- Sometimes
- Rarely
- Never

Examples:

- Patients **often** visit doctors when they feel sick.
- People **sometimes** delay treatment.
- Preventive care is **rarely** used in some areas.

Form:

Subject + adverb + verb

- People **often use** healthcare services.

Grammar Practice

Choose the correct option:

1. People (always / never) need healthcare in emergencies.
2. Patients (often / rarely) go to the doctor for serious illness.
3. Preventive care is (usually / never) cheaper than treatment.

Lesson 03: Reading Text

Supply of Healthcare Services

Supply of healthcare services refers to the availability of medical resources such as hospitals, doctors, and equipment. A strong healthcare system depends on an adequate supply of these resources.

Several factors affect supply. One key factor is government investment. When governments spend more on healthcare, the number of hospitals and trained professionals increases. Another factor is education and training, which ensures a steady number of qualified workers.

However, supply can be limited in some regions. Rural areas often have fewer healthcare facilities and professionals. This imbalance creates challenges in providing equal access to care.

Understanding supply helps policymakers balance resources and improve service delivery.

Vocabulary Focus

- Supply: the amount of services available
- Investment: money used to improve something
- Qualified: having the required skills
- Facilities: buildings and services
- Imbalance: lack of equality

Lesson 04: Grammar Focus

Quantifiers (Some / Many / Much / Few / Little)

Use:

We use quantifiers to talk about quantity.

Rules:

- **Many / Few** → countable nouns
- **Much / Little** → uncountable nouns
- **Some** → both

Examples:

- There are **many hospitals** in cities.
- There is **little access** in rural areas.
- Governments invest **much money** in healthcare.

Grammar Practice

Choose the correct word:

1. There are (much / many) doctors in urban areas.
2. There is (little / few) access in remote regions.
3. Governments spend (many / much) money on healthcare.

Lesson 05: Reading Text

Health Inequality

Health inequality refers to differences in health status and access to healthcare between different groups of people. These differences are often linked to income, education, and living conditions.

People in low-income communities may experience poorer health outcomes. They may have limited access to medical services and preventive care. As a result, diseases may be more common and more severe.

Reducing health inequality is an important goal for policymakers. By improving access to services and addressing social factors, governments can promote fairness in healthcare systems.

Vocabulary Focus

- Inequality: lack of fairness
- Health status: condition of health
- Outcome: result
- Community: group of people living in one area
- Fairness: equal treatment

Lesson 06: Grammar Focus

Modal: Must / Must Not (Obligation & Rules)

Use:

- **Must** → strong obligation
- **Must not** → prohibition

Examples:

- Governments **must improve** healthcare access.
- Resources **must not be wasted**.

Form:

Subject + must / must not + base verb

Grammar Practice

Choose the correct option:

1. Health systems (must / must not) provide basic services.
2. Public funds (must / must not) be misused.
3. Policymakers (must / must not) reduce inequality.

Lesson 07: Reading Text

Health Expenditure

Health expenditure refers to the total amount of money spent on healthcare services in a country. This includes spending by governments, private organizations, and individuals. It covers costs such as hospital care, medicines, and medical staff salaries.

Countries with higher health expenditure often have better healthcare systems. However, high spending does not always guarantee better outcomes. Efficiency and proper management are also important.

Governments must decide how much to spend on healthcare and how to distribute funds. Balanced spending can improve public health while avoiding unnecessary costs.

Vocabulary Focus

- Expenditure: money spent
- Private sector: businesses not controlled by the government
- Public spending: money spent by the government
- Salaries: money paid to workers
- Distribution: how something is shared

Lesson 08: Grammar Focus

Present Continuous (Current Trends)

Use:

We use the present continuous to talk about actions happening now or current trends.

Form:

Subject + am / is / are + verb + ing

Examples:

- Healthcare costs **are increasing**.
 - Governments **are investing** more in technology.
 - People **are using** digital services.
-

Grammar Practice

Choose the correct form:

1. Healthcare systems (are improving / improve) today.
2. Governments (are spending / spend) more money now.
3. Technology (is changing / changes) healthcare rapidly.

Lesson 09: Reading Text

Cost-Effectiveness in Healthcare

Cost-effectiveness is an important concept in health economics. It compares the cost of a treatment with the benefits it provides. The goal is to choose options that give the best results for the lowest cost.

For example, a cheaper treatment that produces similar results to an expensive one is considered more cost-effective. This helps decision-makers use limited resources wisely.

Cost-effectiveness analysis is often used when governments decide which programs to support. It ensures that healthcare systems achieve the maximum benefit for the population.

Vocabulary Focus

- Cost-effective: giving good results for a low cost
- Benefit: positive result
- Analysis: detailed examination
- Option: choice
- Maximum: highest possible

Lesson 10: Grammar Focus

Infinitive of Purpose (to + verb)

Use:

We use **to + verb** to explain purpose (why something is done).

Examples:

- Governments invest **to improve** healthcare.
 - Patients visit doctors **to receive** treatment.
 - Data is collected **to support** decisions.
-

Grammar Practice

Choose the correct form:

1. People exercise (to stay / stay) healthy.
2. Governments plan budgets (to reduce / reduce) costs.
3. Hospitals train staff (to improve / improve) quality.

Lesson 11: Reading Text

Public vs Private Healthcare

Healthcare systems can be divided into public and private sectors. Public healthcare is funded by the government and aims to provide services for all citizens. Private healthcare is funded by individuals or insurance and often offers faster or more specialized services.

Each system has advantages and disadvantages. Public systems promote equality, but they may experience long waiting times. Private systems offer quicker access, but they can be expensive.

Many countries use a mixed system that combines both approaches. This helps balance access, quality, and cost.

Vocabulary Focus

- Public healthcare: government-funded services
- Private healthcare: services paid by individuals
- Sector: part of the economy
- Equality: fairness for everyone
- Mixed system: combination of different systems

Lesson 12: Grammar Focus

Contrast: However / Although

Use:

We use these to show contrast.

- **However** → between sentences
- **Although** → inside a sentence

Examples:

- Public healthcare is affordable. **However**, it can be slow.
 - **Although** private care is fast, it is expensive.
-

Grammar Practice

Choose the correct word:

1. Healthcare is improving. (However / Although), challenges remain.
2. (Although / However) services are available, access is limited.
3. Private care is fast. (However / Although), it is costly.

Lesson 13: Reading Text

Preventive Healthcare and Economic Benefits

Preventive healthcare focuses on actions that reduce the risk of disease before it occurs. Examples include vaccinations, regular screenings, and healthy lifestyle choices.

From an economic perspective, prevention reduces long-term costs. Treating diseases at an early stage is usually less expensive than managing advanced conditions.

Governments often invest in preventive programs to reduce pressure on healthcare systems. These programs improve population health and increase productivity.

Vocabulary Focus

- Vaccination: protection against disease
- Screening: testing for early detection
- Lifestyle: way of living
- Early stage: beginning phase
- Productivity: efficiency in work

Lesson 14: Grammar Focus

First Conditional (Real Future Situations)

Use:

We use the first conditional for real future possibilities.

Form:

If + present simple, will + base verb

Examples:

- If governments invest in prevention, costs **will decrease**.
- If people eat well, they **will stay** healthy.

Grammar Practice

Choose the correct form:

1. If healthcare improves, people (will live / live) longer.
2. If costs increase, patients (will avoid / avoid) services.
3. If governments invest more, systems (will improve / improve).
